Title: Land use in the Fakara in the year 1994

Geospatial_Data_Presentation_Form: vector digital data

Description:

Abstract: This GIS layer, given land use in 1994 is derived from 1/200000? aerial photographs to contribute to the spatial budgeting and modelling work accomplished by ILRI from 1994. Since 2000, land use has been updated and used by ICRISAT under a range of special research project (DGCD Decision Support, DMP, Agrhymet Climate Change)

Purpose: Production of continuous coverage from discontinuous aerial coverage to produce clear readable maps of different spatial scales necessary for unit-referenced data collection to act as a base map for multitemporal overlaying of historical (1950, 1965, 1975) and recent (1994, 1995, 1996, 2002, 2004) land use cover

Process_Step:

Process_Description:

1) Photos interpretations was performed stereoscopically by Pierre Hiernaux. To facilitate the completion of the work, alternating photos were used in the interpretation, rather than using the central portion of each photo, usually done to reduce parallax-related distortion.

2) Ground-control Points

In order to geometrically correct individual map files prior to merging, GPS readings were taken in at least ten locations within the area covered by each aerial photo (exception being photo 273 where ground-control points were not taken). Points were at locations identifiable on the aerial photo interpretations as well as on the ground. These points most commonly were at intersections of line features of the aerial interpretations including paths, livestock paths, field boundary hedges, wadis but also at well-defined point features such as isolated trees, and wells. Every attempt was made for points to be as evenly distributed across the photo area as possible. At least 150 GPS readings were taken at each point using a Trimble Pathfinder Basic Plus GPS Receiver. GPS data for ground-control points were collected on the following dates: 21/3/94, 24/3/94, 05/4/94, 29/7/94, 5/8/94, 16/8/94, 17/8/94, 5/9/94, 13/9/94, 27/9/94, and 28/9/94.

3) Each acetate overleaf was digitized using ATLAS-GIS for DOS software with the assistance of Moussa Mahamane and Aboubacar Maman. The land-use interpretations were digitized into separate files with the feature types of each assigned to separate layers. The land-use files were merged together using the above-mentioned corner points as common reference points.

4) In 2000 Atlas GIS layer was converted to ESRI shape file in ArcView 3 by Bruno Gerard

5) In 2006, proper projection was added to the shape file using 'define projection' in the ArcToolbox (ArcMap 9.1)
